

OFFLINE TRIGGER MONITORING

TDAQ Training
5th November 2010

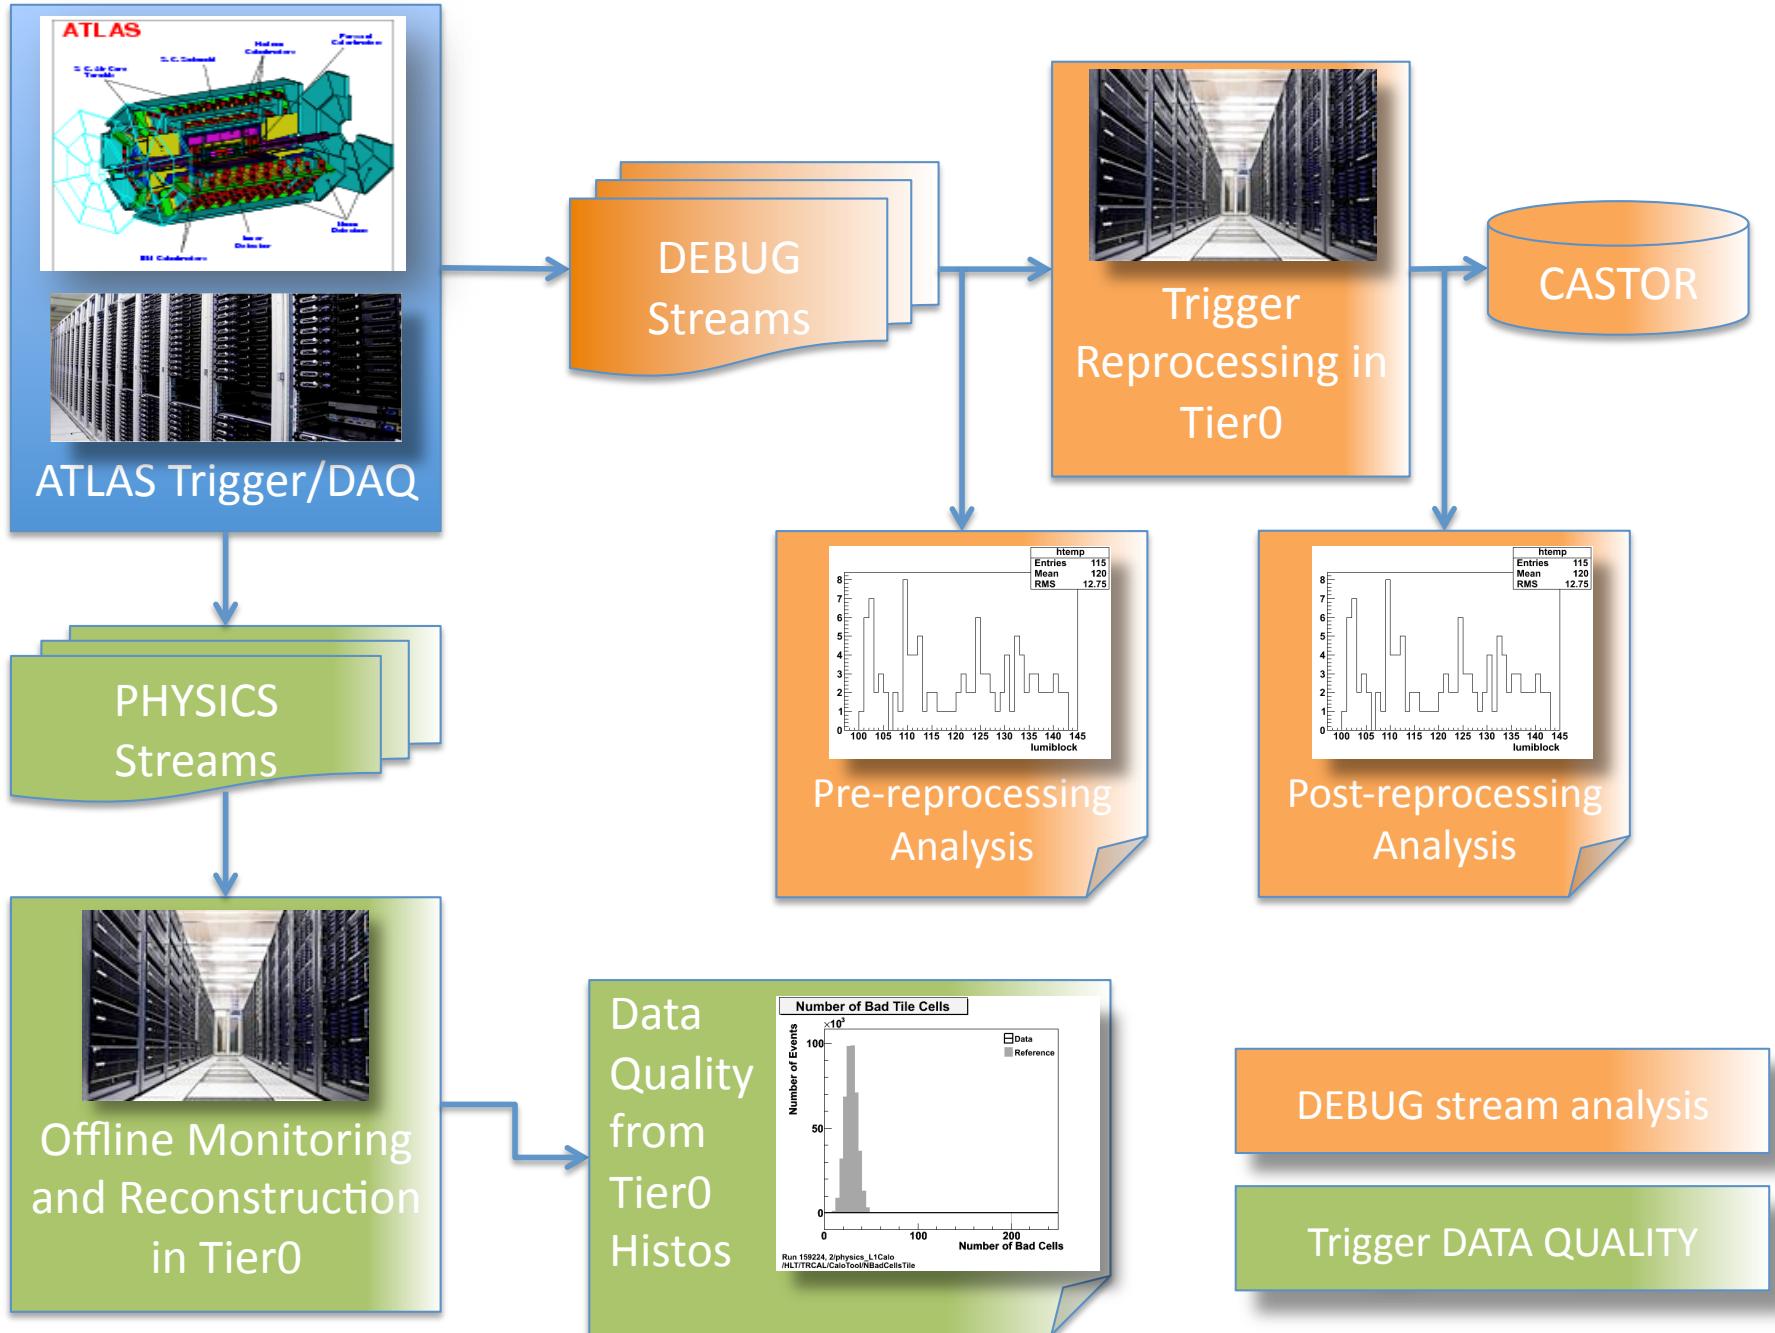

Ricardo Gonçalo
On behalf of the Trigger Offline
Monitoring Experts team

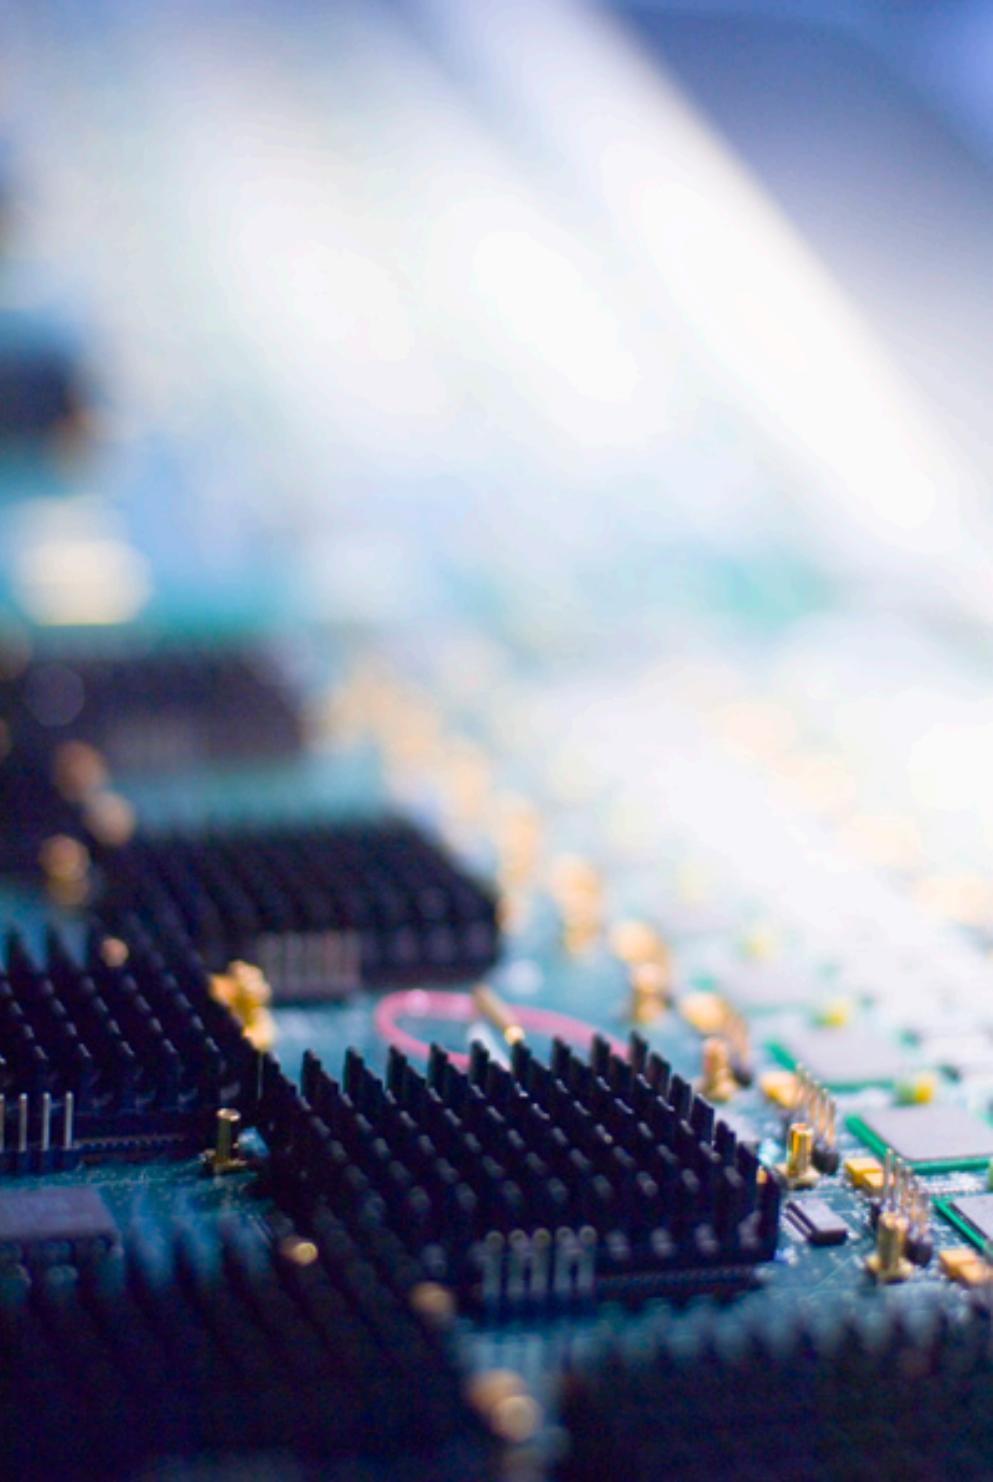

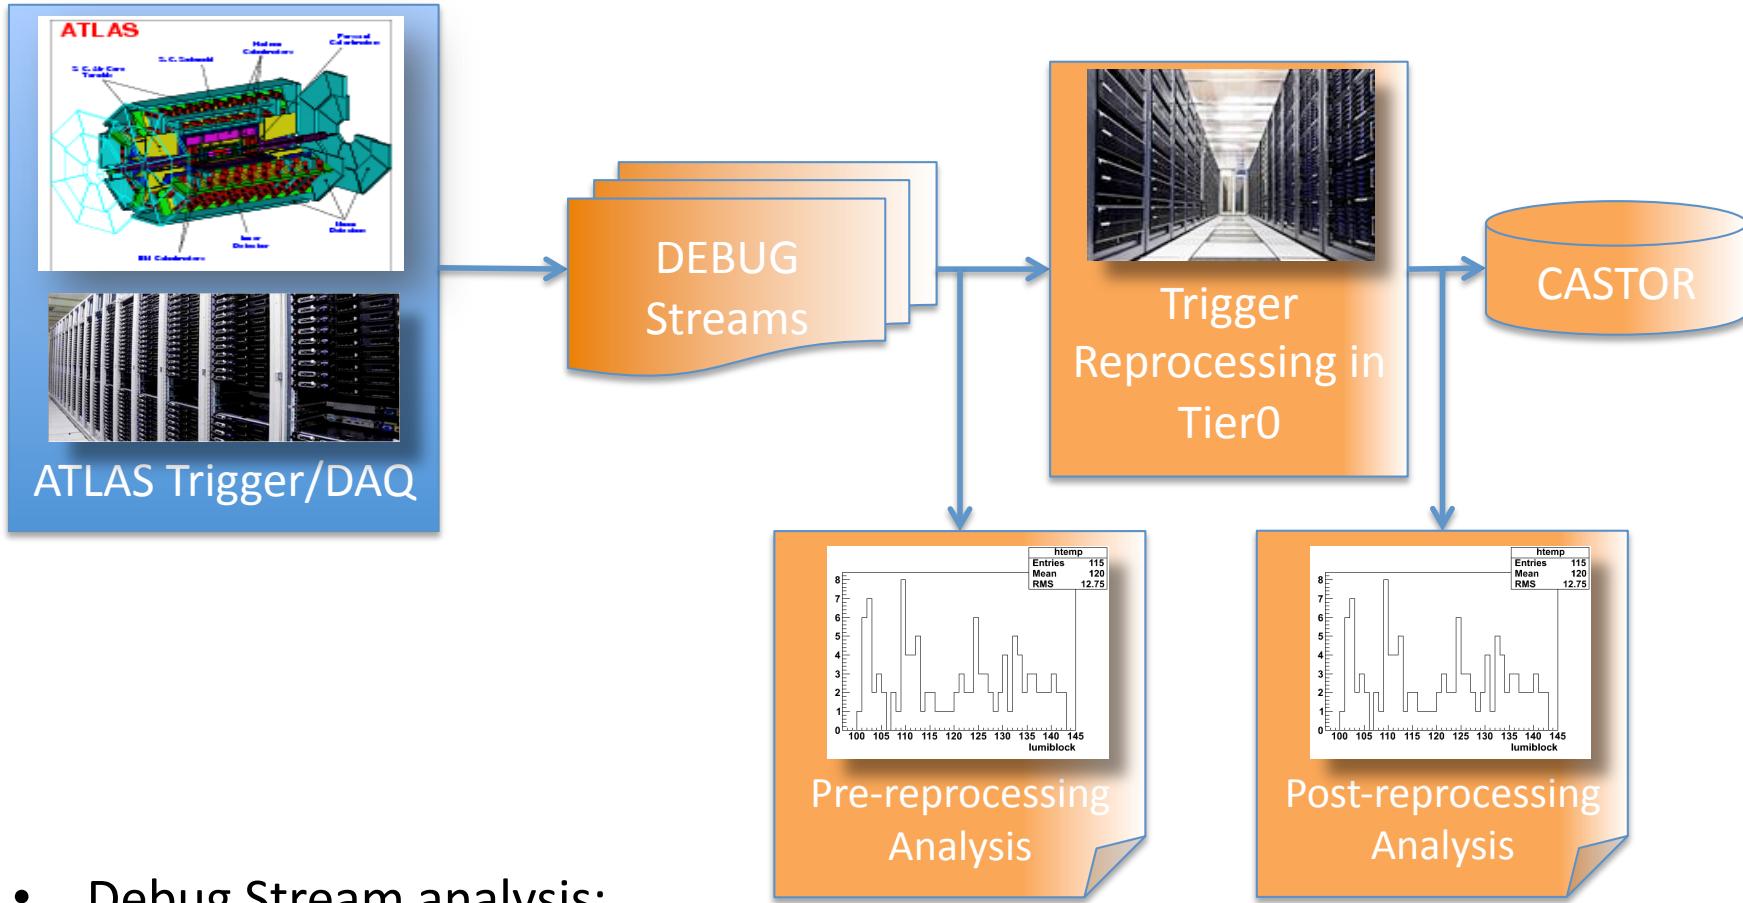

Introduction

- Aims:
 - The offline trigger monitoring shifter has two main tasks:
 - Monitor the **DEBUG STREAM analysis** and recovery
 - Monitor the **trigger DATA QUALITY**
- Practicals:
 - The trigger shifter is in constant contact with a **Trigger Offline Expert** on call
 - A small team of experts rotate to make sure there is always someone on call
 - Will also be able to answer the shifter's questions/doubts
 - The expert will direct the shifter's work
 - Especially in case non-standard operations are needed
 - One shift per day from **9am to 5pm CERN time**
 - Currently in the TDAQ SATELLITE CONTROL ROOM (SCR)
 - Look for category “**TRIGGER OFFLINE MONITORING SHIFTER**” (task 46640) in OTP
 - It will be possible to do this shift remotely once the all the tools are available and the LHC is running smoothly – starting in early 2011
- Organization:
 - The activity is overseen by Alessandro Di Mattia and is an essential part of the **TRIGGER OPERATIONS** area
 - It makes sure that the trigger is working without problems and that the data collected is good for analysis

DEBUG STREAM MONITORING

- Debug Stream analysis:
- Events generating failures either in the **DAQ infrastructure** or the **HLT software**, and for which the HLT can't make a decision, are sent to debug streams:
 - ◆ **Timeouts:** debug_EFHltTimeout, debug_efdProcTimeout, debug_L2HltTimeout, etc
 - ◆ **Crashes:** debug_efdPTCrash, debug_L2ForcedAccept
 - ◆ **Algorithm errors** that abort processing: debug_EFHltError, debug_L2HltError
- They are **reprocessed** in the Tier0
 - A set of tables and analysis histograms are produced **pre-** and **post-reprocessing** to help diagnose the error and monitor the recovery.

- Debug Stream Monitoring:
https://voatlas17.cern.ch/offmon_new/offlineshifter.php
- Webpage dedicated to the use of the offline shifter and expert on call
- Automatically displays the recorded runs and provides a nice way to **keep the information** about past runs
- Provides access to the debug stream contents and to **analysis histograms** before and after **reprocessing**

Offline Trigger Shifter Monitoring

Centralized location for useful links and documentation

Validated runs, in html or in text, useful for e-log

Tick on the checks done, link savannah bugs, add comments (optional)

** for DQ checks, in next slides

- The HLT reprocessing is controlled by the TOM interface which is also used to **do ad-hoc reprocessings** of old runs to test new software, debug errors, etc. At times do special checks on these reprocessings
- Running jobs can be monitored in the conTZole Task Lister:
<https://atlas-tz-monitoring-caf.cern.ch/taskLister.html>
- Shifter must check **failing jobs** in reprocessing

Update TOM Configuration

TRIGGER DATA QUALITY ASSESSMENT

- The trigger software is monitored **online** – each trigger algorithm running on each working node publishes monitoring histograms
- ...and **offline** – monitoring algorithms run in **Tier0** during event reconstruction and produce histograms from online trigger data and comparisons from offline, etc
- Trigger Slice experts take care of checking the monitoring data from each run at the moment
- But this will be increasingly the task of the offline trigger shifter... i.e. YOU**

Trigger DATA QUALITY

- Go to <https://atlasdqm.cern.ch/webdisplay/tier0/>
- Click on the stream and run that you like, e.g. 159224/L1Calo
- Look under HLT: each link corresponds to a trigger domain: e.g. HLT->TRIDT->EFID

- Once you determine if a run is good or bad, update the corresponding **Data Quality (DQ) flags** – only the “**ShiftOFFLINE**” flags are updated by the shifter
- To update DQ flags go to:
<https://atlasdqm.web.cern.ch/atlasdqm/DQBrowser/DBQuery.php>

```

- Results from online and offline checks of histograms, and offline checks of DCS information **combined** with online DQ shifter inputs provide DQ status for each detector.
- Offline expert DQ shifter can override this **DQ decision**.
- Final DQ status for each sub-detectors passed to combined performance groups (e.g. egamma, jets/ETmiss, muons etc) who make decision about suitability for use in physics analysis.

- The flags are then combined with the DQ flags set online and automatically by DQMF and used to select data for analysis using the Good Run Lists
- The shifter can also choose different flags for different luminosity blocks according to stable beams/hlt active.

Go through the **instructions** and arrange to do a **shadow shift** before you take your first shift, so you can get used to the tools.

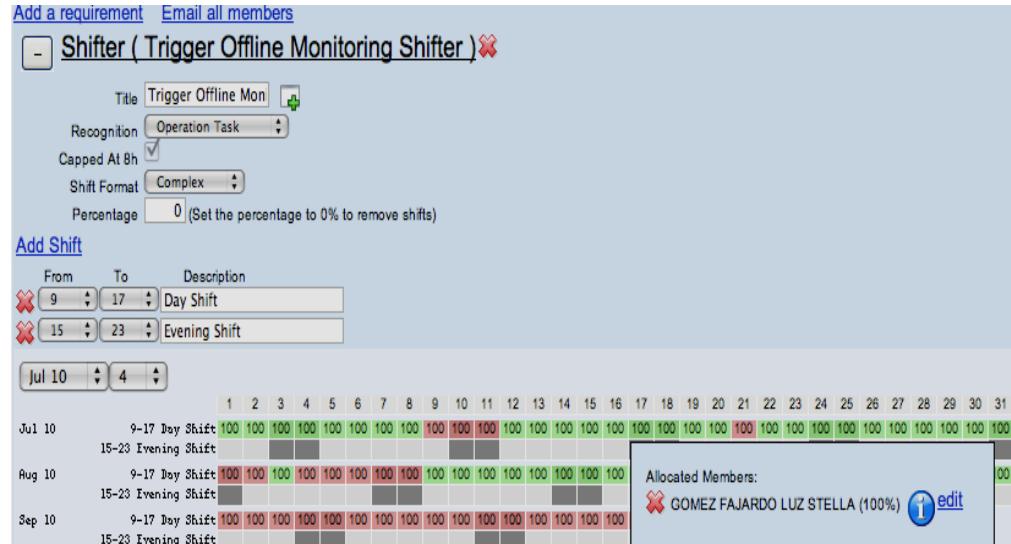

16

SUMMARY

- What do you need in order to do this shift?

- Follow **this training**
- Get a **savannah** account
- Go over the **instructions twiki**
- After the training you'll be able to **book your shift in OTP**
 - Look for “Trigger Offline Monitoring Shifter” (task 46640) in your OTP page
 - **Shadow someone** before you do your first real shift

- What will you do during the shift?

- Check reprocessing and analysis of **DEBUG STREAM**
- Check TIER0 Trigger histograms for **OFFLINE DQ**
- Check results of **ad-hoc represessings** if necessary
- Always be **in contact with the offline trigger expert** – inform her/him of what you find

B # FONT

Blah... blah... blah...

- What will you do at the end of your shift?
 1. Write an **informative** e-log summary
 - Remember to specify in the subject that this is trigger offline monitoring
 2. Write anything new in the Offline monitoring **Whiteboard** for the next shifter

- And remember, all **ATLAS data is important!**
 - Good Data Quality Monitoring is essential for good physics data
 - Data reprocessings are essential to maintain and improve the trigger
 - The debug stream analysis is essential to debug the trigger... and it may even show new physics!
